THELEAGUE APP SUMMARY
Source basis: repo code/docs in /Users/thomasjones/Documents/theleague-app only.

WHAT IT IS
TheLeague is a web application for fantasy league management and history preservation.
It combines league imports, member/season operations, finances, and recap generation.

WHO IT'S FOR
Primary persona: fantasy league commissioners and co-commissioners.

WHAT IT DOES
- Creates and manages leagues with member roles (commissioner/co-commissioner/member).
- Imports season data from ESPN, Sleeper, Yahoo, and Fleaflicker (validate/import routes).
- Stores historical league entities in PostgreSQL via Prisma (seasons/teams/weeks/matchups).
- Supports invite links and invite acceptance flows for joining leagues.
- Provides finance tracking: dues, payouts, fines, summaries, and dues generation.
- Generates weekly newsletter content from completed matchup results.
- Handles paid subscriptions using Stripe checkout and webhook routes.

HOW IT WORKS (REPO-EVIDENCED ARCHITECTURE)
- Frontend/UI: Next.js App Router pages under src/app/* for dashboard and league workflows.
- Auth: Clerk middleware and helpers in src/middleware.ts and src/lib/auth.ts gate access.
- API: Next.js route handlers in src/app/api/* enforce auth/roles and mutate/read data.
- Data: Prisma ORM (prisma/schema.prisma) maps app models to PostgreSQL tables.
- Import flow: /api/espn/import calls Python FastAPI service (services/espn-importer/main.py),
  then upserts normalized season/team/week/matchup records into Prisma.
- Integrations: Yahoo OAuth routes and Stripe billing routes are implemented.
- Scheduled background worker runtime: Not found in repo.

HOW TO RUN (MINIMAL GETTING STARTED)
1. npm install
2. pip3 install -r services/espn-importer/requirements.txt
3. cp .env.local.example .env.local and set DATABASE_URL, Clerk keys, ESPN_SERVICE_URL
4. npx prisma generate && npx prisma migrate dev
5. npm run dev (starts Next.js and ESPN importer service)
